Continuous Validation

Validation (running in background) gives an immediate feedback about:

syntax errors

control-flow errors

and even some pragmatic errors:

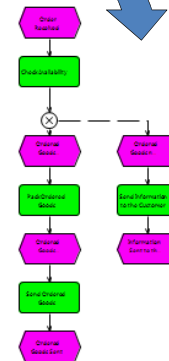

Modelling Wizard

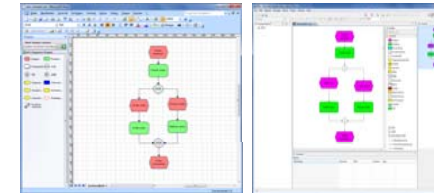

Mouse-less modelling helps to save a lot of time:

generates

Export / Import

imports models from:
MS Visio 2003 / 2007
Semtalk,
EPCTools,
Oryx
ARIS (version 5-7)

exports models to:
MS Visio 2003 / 2007
Semtalk,
EPCTools,
Oryx
ARIS (version 5-7)
YAWL

Own export / import formats can easily be added – without the need to understand our internal data format and even without having to compile bflow* Toolbox

Open for Integrating your own Tools

Using our tool-chain concept, you can easily integrate your own tools into bflow*

WITHOUT the need to understand our internal data format
WITHOUT finding out how to start an external program from within the bflow* Toolbox (bflow* will do that for you)
WITHOUT changing the metamodel if you need to add attributes to modelling elements
WITHOUT writing code that transfers the answers given by your tool back into the user interface of the bflow* Toolbox

... and often even without having to recompile the bflow* Toolbox
